

Integrated evidence across human-genetic layers

Evidence layer	Analysed universe	Multiplicity-controlled result	Biological interpretation supported
Genome-wide LDSC	112 pairs	0 global FDR	No broad common-variant correlation signal
Primary HDL-L	116,472 blocks / 47 pairs	0 global-local FDR	No stable block-level sharing under primary model
Native LAVA audit	26,639 rows	9 native FDR; 8 boundary-sensitive	Rows require sensitivity interpretation; no stable locus claim
Bidirectional MR	224 directions	1 FDR-positive; orientation unsupported	No validated direction of retinal mediation

Primary conclusions are based on complete declared families; nominal and unresolved rows remain in the supplement.
